C3 Quantitative Chemistry AQA Trilogy	When magnesium burns, the mass increases. Explain why and write an equation 	Write the equation for calculating the number of moles in a given mass (You need to be able to rearrange this) 	What is meant by the term limiting reactant?
State what is meant by the law of conservation of mass	When calcium carbonate thermally decomposes, the mass decreases. Explain why and write an equation	Calculate the number of moles in: 66g of carbon 28g of N_2 gas 88g of CO_2	Calculate the mass of aluminium oxide formed when 135g of aluminium is burned in air $4Al + 3O_2 \rightarrow 2Al_2O_3$
Relative formula mass (M_r) is calculated by adding the relative atomic masses of the atoms in the compound. Calculate the M_r of the following compounds: CO_2 H_2O NaCl $CuSO_4$	Using M_r show that mass is conserved in the following reaction: $2Li + F_2 \rightarrow 2LiF$	Calculate the mass of carbon in 4 moles of CO_2	Write the equation used to calculate concentration (You need to be able to rearrange this)
Find the percentage of sodium in sodium carbonate (Na_2CO_3)	What is the symbol for moles? What is the value of Avagadro's constant? The mass of 1 mole is = to the _____	8.1g of zinc oxide reacts completely with 0.6g of carbon to form 2.2g of carbon dioxide and 6.5g of zinc. Write a balanced symbol equation (A_r C=12, O = 16 Zn = 65)	Calculate the concentration in g/dm^3 of a solution of sodium chloride where 30g of sodium chloride is dissolved in 0.2dm^3 of water
